

Keepa API Mode Prototypes

Five ways MSW Overwatch can request Amazon data through Keepa

STATUS: Prototypes for discussion. Items 1–4 exist in the app today (API mode). Item 5 needs a code change (Keepa update=1). Trigger Import Run Now is not API mode — it uses an uploaded Keepa Excel file and does not crawl Amazon.

How a request works

MSW Overwatch never talks to Amazon. In API mode it asks Keepa’s Product API (UPC, US domain, offers, buy box). Keepa returns cache if it is fresh enough (typically within about 1 hour). If the cache is older, Keepa crawls Amazon, stores a new snapshot, then replies. Overwatch then drops stale/used/OOS/scam offers (lastSeen older than 48 hours) and compares remaining prices to MAP.

Prototype comparison

#	Prototype	When to use	Freshness	Analytics
1	Morning Daily Run	Normal ops	Once/day at 6:00 AM Chicago	1 Daily Run
2	Same Day Run	Second full-vendor pull same day	Two Keepa asks that day	1 day, 2 emails
3	Express Job	Spot-check a UPC subset now	Now, those UPCs only	Not a Daily Run
4	Buy-box only	Save tokens; featured offer only	Same crawl rules	Depends on job type
5	Live-leaning (proposed)	Force Keepa live-pull if >1h old	Best per request; more tokens	Same as 1–3

1 — Morning Daily Run (current default)

One scheduled API pull per vendor. Cheapest full-catalog snapshot. Data is “what Keepa had at 6:00 AM Chicago.” Stay on buy box + other sellers below MAP and offers $\approx$ 50.

Use when daily monitoring is enough. Analytics: 1 run.

2 — Same Day Run (second API pull)

Keeps the 6am schedule. Adds a one-off later the same calendar day (countdown). Uses current scheduler API mode, not an uploaded file. Does not change tomorrow’s cron. Analytics still counts one day; both jobs can email.

Use when MAP changed, Amazon moved, or the morning pull missed something.

3 — Express Job (on-demand subset)

Create an Express Job: pick UPCs, vendor, offers limit (20–100+), and buy-box only vs all sellers. Fastest way to refresh some listings without waiting for the vendor Daily Run. Express Jobs are not counted in Off-Price Analytics Daily Runs.

Use for one brand, a short list, or a higher offers cap than Daily Run.

4 — Buy-box-only API (cheaper, less complete)

Same API mode, but `off_price_scope = buybox_only`. Fewer tokens and faster, because Keepa can omit the marketplace offer list. Hidden 3P sellers below MAP will not show. Prototypes 1–3 should stay on all sellers if you want the full picture.

Use only if you accept missing competing marketplace sellers.

5 — Live-leaning API (proposed — needs code)

Today Overwatch does not send Keepa’s update flag. This prototype would send update=1 so Keepa live-pulls Amazon when its cache is older than 1 hour. You would still use Daily Run, Same Day Run, and Express Job as the triggers. update=0 (always live) is usually too expensive for a full vendor list.

Not built yet. More Keepa tokens per request; best freshness per ask.

Recommended mix

Goal	Use
Normal ops	Prototype 1 — morning Daily Run, all sellers, API mode
Same-day full vendor refresh	Prototype 2 — Same Day Run (still API mode)
Spot-check a few UPCs now	Prototype 3 — Express Job
Save tokens	Prototype 4 — only if buy-box-only is enough
Max freshness per request	Prototype 5 (code) + still use 1 and 2

Stay in API mode on the vendor Daily Run page. Uploaded Excel + Trigger Import is a different data source and will not crawl Amazon.
