FBA Order Checker

Implementation summary — MSW Overwatch

MetroShoe Warehouse
October 2026 · App v3.7.2

STATUS: SUCCESSFULLY IMPLEMENTED

FBA Order Checker is a gated BC Tools page under BC Tools → FBA Order Checker. Authorized users upload the official Amazon FBA shipment .tsv. The tool keeps Shipment ID, Merchant SKU, external-id, and Shipped, then lets people scan and count together on one shared count. Owners can lock or share a shipment, download an accounting report, archive a finished count, or move a shipment to Trash.

WHAT IT DOES

FBA Order Checker keeps the yellow fields from the official Amazon FBA shipment file so a count can continue after someone leaves the page. Several people can see the same upload and add to the same count, and the page refreshes on its own. A new upload never deletes an earlier one.

BUSINESS VALUE

One shared list of official shipment files

Each worker's scans stay separate, even on a shared shipment

Missing, complete, overage, and unknown barcodes are color-coded

Finished counts can be downloaded and archived; removals go to Trash first

HOW A COUNT WORKS

Step	What happens
1. Open tool	Sidebar BC Tools → FBA Order Checker (allowlisted emails + superadmin only)
2. Upload	Drop or browse the official Amazon shipment file (.tsv / .txt / .csv, max 15 MB) and choose Store shipment
3. Count	Open View. Each scan of an external-id / UPC adds 1 to that person's Counted. Shipped stays the file quantity
4. Finish	Download the accounting workbook at any time. Archive appears for the owner when every line is All Accounted
5. Remove	Remove asks for confirmation, then moves the shipment to Trash. It stays there until Delete or Empty trash

LIST VIEWS

View	What it shows
Active	Uploads that are not archived and not in Trash. Default list. All or Mine, plus search by shipment, SKU, external-id, or name
Archive	Completed shipments. Archive is allowed only after every official line is All Accounted for the owner
Trash	Removed shipments. Restore puts one back. Delete removes one for good. Empty trash clears the bin after a second confirmation

WHAT IS STORED

Stored	Rule
Shipment ID	Taken from the preamble of the official TSV (for example FBA19T3YGF07). A new upload of the same id does not replace the earlier one
Merchant SKU	Yellow column only. Title, ASIN, FNSKU, condition, prep, and label columns are ignored
external-id	Stored and shown as the code only. A leading UPC: label is stripped (UPC: 845028000003 becomes 845028000003)
Shipped	File quantity. It does not decrease when someone scans. Missing is the remainder while the count is still short
Uploaded by	First name only. A profile name such as Orville is used. If no profile name is set, the first word of the email name is used

COUNT STATUSES

Example: Shipped is 3. One scan shows Counted 1, Missing 2, Missing Items. Three scans show All Accounted. A fourth scan shows Overage. If the same external-id is on more than one line, the scan fills the first line that is still short. Unknown scans do not block All Accounted.

Status	When	Highlight
Missing Items	Counted is less than Shipped	Amber row
All Accounted	Counted equals Shipped	Green row
Overage	Counted is greater than Shipped	Orange row
Not in the list	Scanned code is not on this shipment. It is still recorded	Red row, plus an on-screen error

LOCK, SHARE, REPORT, AND ARCHIVE

A new upload is Shared. The owner can Lock it so other workers cannot open it, then Share it again when more than one person needs to count. Download is on every row and on the open shipment. The workbook is named {Shipment ID} Accounting.xlsx and uses the signed-in user's counts. Archive is on the open shipment only, and only for the owner after every official line is All Accounted. Archived shipments move to the Archive tab.

TRASH

Remove sits apart from Lock and opens a confirmation: "Are you sure you want to remove this shipment?" Confirming moves it to Trash. It leaves Active and Archive and stays in Trash until someone deletes that shipment or empties Trash. Both of those actions ask again. Restore returns an active shipment to the active list, or a completed one to Archive. Scanning is blocked while a shipment is in Trash.

WHO CAN USE IT

User	Access
Allowlisted emails	sunshine@, stephanie@, paolo@, paulo@, johnbernard@ (metroshoewarehouse.com)
Superadmin	Sees locked shipments and can lock, archive, or remove others' uploads
All other users	No sidebar link; route and API are blocked

DATABASE SCRIPTS

Run these in the Supabase SQL Editor, in this order. The API uses the service role. If a column is missing, the shipment list will not load.

Script	Adds
create_fba_shipment_library.sql	Uploads and yellow-field lines
create_fba_shipment_counts.sql	Per-user scan counts
create_fba_shipment_unknown_scans.sql	Barcodes not on the file
add_fba_shipment_library_access.sql	Lock, share, and archive
add_fba_shipment_library_trash.sql	Trash (trashed_at, trashed_by)

KEY RULES

Shipped is the file quantity. Missing is what is still uncounted. A scan never rewrites Shipped

Counts belong to the signed-in user. Sharing a shipment does not merge two people's counts

Only the owner (or a superadmin) can lock, archive, or remove an upload

Permanent delete is available only from Trash, or by emptying Trash

ROLLOUT CHECKLIST

- [ ] Run the five SQL scripts in the Supabase SQL Editor before counting, locking, or using Trash
- [ ] Confirm FBA Order Checker under BC Tools only for the allowlist and superadmin
- [ ] Upload an official .tsv; confirm SKUs, external-id without UPC:, and Shipped totals
- [ ] Scan one unit: Counted +1, Missing drops, status moves Missing Items → All Accounted → Overage
- [ ] Scan a code that is not on the file: red row, Not in the list, and the banner stays on screen
- [ ] Lock hides the shipment from other workers. Share opens it again. Counts are shared: everyone who can open the shipment sees every scan
- [ ] Download works before the count is finished. Archive waits until every line is All Accounted
- [ ] Remove asks first, then lands in Trash. Restore, Delete, and Empty trash behave as labeled

NOTES FOR LEADERSHIP

Shipped on web / desktop app version 3.7.2

Route /fba-shipment-library · Sidebar BC Tools → FBA Order Checker

Same allowlist as FBA Box Contents. Does not replace carton workbooks, Upload Compare, Keepa, Daily Runs, or Label Station
