Label Center

Implementation summary — MSW Overwatch

MetroShoe Warehouse
October 2026 · App v3.7.2

STATUS: SUCCESSFULLY IMPLEMENTED

Label Center prints carton labels in the browser and the desktop app. Staff enter a TO number and the boxes to print (one box, a range, or a list), or pick a text label. Stock is 2.25 × 1.5, 3 × 2, or 6 × 4 in. On the desktop app the job goes straight to a chosen Zebra. Everyone sees Label Center except hello@warehouserepublic.com.

WHAT IT DOES

Label Center prints carton labels without a catalog lookup. One section builds a page for each box on a transfer order. The other prints a short floor message, such as a ready-to-bag or ready-to-receive notice, sized to fill the same stock.

BUSINESS VALUE

One TO number, many box labels, generated in the browser

Ranges and lists print only the boxes that were typed

Floor messages use the same stock size as the TO / box labels

Desktop users can print Label Center in the app, except hello@

HOW A PRINT RUN WORKS

Step	What happens
1. Open tool	Sidebar Label Center on the web and in the desktop app (hidden on desktop for hello@warehouserepublic.com)
2. Choose stock	2.25 × 1.5 (default), 3 × 2, or 6 × 4 in. The choice is remembered on this computer.
3. Enter the job	Type the TO number and the boxes, or pick / type a text message
4. Generate	The app builds the PDF locally and draws a preview of every page
5. Print or save	Desktop: Print sends ZPL to the chosen Zebra. Browser: Print opens the system dialog. Download PDF saves the file.

LABELS AT A GLANCE

Label	Input	Output
TO / box labels	TO number plus one box, a range (1-10), or a list (1,2,8)	One page per box at the chosen stock; CODE128 of the TO number
Text label	A preset message or custom text (up to 180 characters)	One label at the chosen stock; bold type grows until it fills the page

TO AND BOX LABELS

Each box is its own PDF page. The barcode is the TO number, so every carton in the run scans to the same transfer order. The box number is printed and underlined on the right.

Item	Detail
Stock	2.25 × 1.5 (standard), 3 × 2 (Apparel stock), or 6 × 4 in. The 3:2 artwork scales. A 6 × 4 label is turned 90° for a Zebra print head.
TO number	Letters, numbers, and hyphens; stored uppercase with spaces removed; max 32 characters
Boxes	One number, an inclusive range, or a comma list in the order typed. Box numbers start at 1. At most 200 labels per run.
Barcode	CODE128 of the TO number on every page (no human-readable digits under the bars)
Layout	Rounded border, centered TO, barcode, then Box and the underlined box number
File name	TO123-box-4.pdf, TO123-boxes-1-10.pdf for a range, or TO123-boxes-1-2-8.pdf for a short list

TEXT LABEL

Four floor messages are one click. Custom text uses the same fit: the largest bold type that still sits inside the border.

Item	Detail
Presets	BARCODES NEED COVERED · READY TO BAG BARCODES COVERED · BAGGED READY TO LABEL · LABELED READY TO RECEIVE
Custom text	Any message up to 180 characters. Blank lines are collapsed. A line break starts a new line on the label.
Fit	Bold Helvetica grows as large as it can while staying inside the border. A single paragraph is broken into the line split that fills the label best.
Stock	Same chosen size and rounded border as the TO / box label
File name	Lowercase slug of the message, such as barcodes-need-covered.pdf

WHO HAS ACCESS

User	Access
Web	Anyone who can open Label Station (Keepa access or a warehouse account)
Desktop	Every signed-in desktop user sees Label Center
hello@warehouserepublic.com	Hidden on the desktop app; /label-center opens Label Station

TECH NOTES

UI: LabelCenter.tsx · route /label-center

TO / box PDF: toBoxLabel.ts (jsPDF + JsBarcode)

Text PDF: textLabel.ts (same page size)

Desktop gate: isLabelCenterAvailable in privatePath.ts

Built in the browser — no API and no database table

Desktop print: labelCenterPrint.ts turns each page into ZPL and sends it with printer:printZpl

Preview and Zebra art use the PDF.js legacy build (src/lib/pdfjs.ts) so Electron's older browser can draw the label

KEY RULES

Both label types use the stock size selected at the top of the page

A comma list prints only those boxes, in the order typed — it does not fill the gaps

Changing the TO or the box field clears the current preview until Generate is clicked again

Label Center does not look up the warehouse catalog and does not replace Label Station or FNSKU Labels

ROLLOUT CHECKLIST

- [ ] Web: confirm Label Center in the sidebar for a Keepa user and a warehouse account
- [ ] Desktop: sign in as any account other than hello@ and confirm the Label Center link
- [ ] Desktop hello@warehouserepublic.com: no Label Center link; a direct /label-center URL lands on Label Station
- [ ] TO TO123456 with boxes 1-3: three preview pages, barcode encodes TO123456
- [ ] Boxes 1,2,8: three labels in that order, not boxes 3 through 7
- [ ] Reject an empty TO, a reversed range such as 10-1, and a run over 200 boxes
- [ ] Text preset BAGGED READY TO LABEL fills the chosen stock; Print and Download both work
- [ ] Desktop: pick the Zebra, match 203 or 300 dpi, and confirm Print sends the label without the Windows dialog

NOTES FOR LEADERSHIP

Current web / desktop app version 3.7.2 (stock sizes, direct Zebra print, and the PDF engine used to draw labels)

Route: /label-center · Sidebar: Label Center

On the desktop app, Label Center is shown to every account except hello@warehouserepublic.com. The web stays open for Label Station users.

Windows desktop auto-update is GitHub release v3.7.2

Does not touch Keepa jobs, Daily Runs, MAP, or the Label Station product catalog
